Correction: Comparison of “Live High-Train Low” in Normobaric versus Hypobaric Hypoxia

The inspired fraction of oxygen (F_{O2}) for the normobaric hypoxic condition was incorrectly reported to be 15.8 ± 0.8%. The correct F_{O2} value for the NH condition is 17.9 ± 0.2% and the correct inspired pressure of oxygen (P_{O2}) values were 111.1 ± 1.1 vs 111.5 ± 1.0 mmHg in normobaric and hypobaric hypoxia, respectively. The authors wish to clarify and confirm that the simulated altitude was perfectly matched to the real altitude of 2250m. The error appears only in the paper. This correction has no impact on the living altitudes between the two hypoxic conditions, as P_{O2} was strictly matched between conditions.

As a result, there are errors in Fig 4. Please see the updated Fig 4 here.
